## Effective and gentle expression with Microlife breast pumps.

Microlife breast pumps allow nursing mothers to express their breast milk easily and in the comfort of their own homes. If not enough breast milk is taken from mothers who have recently given birth, this can lead to the painful build-up of milk, which in the worst-case scenario could cause inflammation of the nipples (mastitis). This build-up of milk can be prevented through targeted expressing of breast milk using the breast pump. In addition, breast pumps help to alleviate cracked or sore nipples.

You can use the integrated stimulation function to draw out flat or inverted nipples, making it easier to then express the breast milk. The breast pump also allows you to store breast milk in the bottle, for example if you will be travelling, or away from your baby for an extended period of time. Babies who cannot be breast-fed directly for health reasons (due to a premature birth or cleft palate) can still be given breast milk by using the breast pump and feeding the baby using a bottle and teat.

## Individual solutions for the best possible support for a great and long lasting breastfeeding experience.

### Manual breast pump

Microlife manual breast pumps are an excellent choice for mothers who express their breast milk occasionally. The innovative design is easy to assemble, lightweight and ultra-silent. No battery or mains power is required as they are operated individually by hand. They are ideal for using on-the-go and are almost silent during use.

### Single electric breast pump

Microlife electric breast pumps are designed to mimic your baby's natural feeding action, for more comfort and more milk. Ideal for mothers who want to comfortably express their breast milk every day. Powered by batteries or mains adapter to allow comfortable expressing anywhere.

### Dual electric breast pump

Microlife double pumping systems are the perfect time saver for mothers: The dual breast pump vacuum technology can express more milk in a shorter period of time than conventional breast pumps. Simultaneous expressing of milk at both breasts is proven to be more efficient and may even boost your ability to produce breast milk.
